TYPES OF TRIGGERS IN BUILDS

Openshift from scratch

❑TYPES OF TRIGGERS DEFINED IN BUILDCONFIG

❑**Webhook Triggers:** Webhook TRIGGERS allow you to launch a new build by sending a request to the OpenShift Container Platform API endpoint. They can be defined on gitHub, GitLab, Bitbucket, or create generic webhooks.

❑**ImageChange**: Allows you to launch a build automatically when an associated image changes.

❑**Config:** The build is launched by making a configuration change. In this version, it only works when creating a new BuildConfig, it's not enough to just modify it. To be changed in a future release
